Bug Report #9: Page Content Overlapping with Header

UI Issue Causing Content to Be Hidden Under Header Due to Layout Overflow

Description:

A front-end layout issue was detected where portions of page content were rendered beneath the fixed header. This occurred particularly on pages with lengthy content or large divs, reducing readability and disrupting user experience.

Steps to Reproduce:

1. Navigate to a page with a significant amount of content.

2. Scroll or load the page.

3. Observe how the top content appears partially or fully hidden under the header.

Expected Behavior:

All content should appear fully visible and properly spaced below the fixed header.

Actual Behavior:

The content area sometimes started beneath the header, causing overlap and visual obstruction.

Severity: Medium

Affected Component: Frontend UI / Page Layout

Root Cause:

Absence of spacing compensation for fixed header and excessive div heights on some pages.

Fix Implemented:

Implemented a pagination system to reduce on-screen content volume and resized div elements to ensure they remain within visible bounds and do not overflow into the header area.
